Overview

- FlexFeed is a dynamic social media aggregator.
- Our users can see posts from Twitter, Instagram, and Facebook in one feed.
- Users form categories of the social media accounts they rely on for news and information.

Targeted Users

- People that rely on Social media for news
- Investors
- People who want to stay updated with the things they are interested in, while also keeping them organized

Live demo...

What was easy?

- Taking the concepts from the Local Library tutorial and applying them to our application helped to see things done out step by step before trying to do it on our own
- Sharing the work equally between the group members - not too hard to find tasks for every person
- Staying civil and kind in potentially stressful situations - courteous and polite group members

What was hard?

- Team communication was difficult sometimes to find a time when we were all available to meet together with 6 people
- GitHub some issues with merging conflicts, not sure when to override which changes
- Database took us some time to realize that two people can't be updating the database at the same time because it would lead to other issues

Future Improvements

- Incorporate Facebook, Twitter, and Instagram API's instead of using mock
- Ability to view multiple/all groups at once
- Ability to follow organizations without putting them in a group
- Being able to have "friends"
- Generally more user friendly UI

Q&A
